What is Control Reliable?

“Control Reliability”, essentially states that the safety system be designed, constructed and installed such that the failure of a single component within the device or system should not prevent normal machine stopping action from taking place, but shall prevent a successive machine cycle from being initiated until the failure is corrected. To achieve “Control Reliability”, a device should feature both redundancy and fault detection.

Where is it Used?

Control Reliable Hydraulic Safety Valves are applicable wherever hydraulic safety is a concern. These applications may include:

• Hydraulic Presses
• Rubber Molding
• Coil Slitting Lines
• Actuator Isolation
• Paper Processing and Roll Handling
• Metal Forming (Cutting, Bending, Punching, Forming)

Safety Standards Defined

The EN 954-1 standard (Categories B-4) that has been the staple of safety definition is being phased out and replaced by ISO-13849-1 PL (Performance Level). Below are the brief summaries of requirements for each definition:

ISO-13849-PLd (Safety Category 3): The safety control system must be designed such that a single fault will not lead to a loss of the safety function. Where practical, the single fault will be detected. This requires redundancy from the safety device through the load control device. Multiple faults may lead to a loss of the safety function.

ISO-13849-PLe (Safety Category 4): The safety control system must be designed such that a single fault will not lead to a loss of the safety function and will be detected at, or before, the next demand on the safety system. If this is not possible, then the accumulation of multiple faults must not lead to the loss of the safety function. This also requires redundancy from the safety device through the load control device. Here multiple faults must not lead to a loss of the safety function.

Sidener’s Control Reliable Valves are suitable for ISO-13849 PLd or ISO-13489 PLe applications and are currently pending TUV Certification.
How It Works

Two Types of Control Reliable Valves Available to Cover All Your Safety Application Needs.

**Energy Isolation Valve**
Sidener’s Energy Isolation Valve functions as a two position 3-way hydraulic valve with redundant valving elements and redundant monitoring.

The purpose of the valve is to, when energized, provide a flow path for a flow of hydraulic fluid from its source to the hydraulic system. When de-energized, the valve blocks flow from the hydraulic energy source and vents the hydraulic system to tank.

The hydraulic circuitry features a series flow condition from the inlet of the valve through redundant valving elements to the discharge of the valve. It also features a parallel flow condition from the discharge of the valve through either or both of the valving elements to the tank port. This configuration assures that if a valving element fails to operate as requested, inlet flow will be blocked and fluid from the outlet side of the valve is directed to tank.

Safety Rated Monitoring Switches indicate the movement of the redundant valving elements.

Operation of the Safety Rated Monitoring Switches is typically monitored by a Safety Relay or a Safety PLC supplied by others.

**Blocking Valve**
Sidener’s Blocking Valve functions as a two position 2-way hydraulic valve with redundant valving elements and redundant monitoring.

The purpose of the valve is to block flow in a hydraulic system.

A common application is to block flow in a hydraulic cylinder to inhibit cylinder movement caused by gravity.

Safety Rated Monitoring Switches indicate the movement of the redundant valving elements.

Operation of the Safety Rated Monitoring Switches is typically monitored by a Safety Relay or a Safety PLC supplied by others.

Engineered Systems, Products and Services
Since 1957, Wainbee has been supplying components and engineered systems to customers in a wide range of industries. By partnering with customers across a multitude of markets we are able to design new or enhance existing systems.

Coast-to-Coast Technical Support
As the market leader and one of Canada’s largest industrial distributors, Wainbee has 16 offices with a comprehensive team of engineering and technical staff coast to coast. Our sales and tech teams are equipped to provide technical support from all our products, across all market and industry segments, for your application and productivity success.

Unsurpassed Customer Service
Wainbee is an employee-owned and managed Canadian company. We pursue excellence in our technical expertise, solutions and service, take pride in the work we do, and bring the best practices to our customers.

Note: other lower safety level monitored valves for category 2 are available upon request.
